  - Diagram & Form: end of handout

Disney's One Hundred and One Dalmatians (1961)

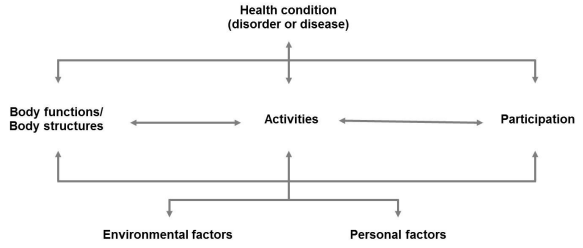
Objectives

- Describe elements of the ICF model that may impact individual goals in regards to lower extremity orthosis recommendations.
- Describe crucial elements of examination including gait kinematics, neuromotor function, and musculoskeletal structures which inform orthotic recommendations.
- Discuss movement system analysis for gait and foot/ankle findings in pediatric practice.
- Apply movement system analysis concepts and the ICF model to make orthotic recommendations.

Why the difference in recommendations?

What is your idea of the perfect brace?

Perfect Brace: ICF Model



World Health Organization. (2001). International classification of functioning, disability and health : ICF. World Health Organization.

Varied Recommendations: ICF Model

- Prioritizing Body Functions and Structures versus Activity and Participation may lead to different recommendations
- Each clinician filters the impact of Environmental and Personal Factors through the lens of their own values and experiences
- Use of a movement system approach can help to facilitate these complex conversations

Varied Recommendations

- Evidence-Based Practice?

Research Challenges: Ethics

Smith, GS. ***Parachute use to prevent death and major trauma*** related to gravitational challenge: ***systematic review*** of randomised controlled trials. BMJ 2003;327:1459.

- Authors were unable to identify any randomized controlled trials of parachute intervention.
- "The basis for parachute use is purely observational, and its apparent efficacy could potentially be explained by a 'healthy cohort' effect".
- "As with many interventions intended to prevent ill health, the effectiveness of parachutes has not been subjected to rigorous evaluation by using randomised controlled trials. Advocates of evidence based medicine have criticised the adoption of interventions evaluated by using only observational data.
- *"We think that everyone might benefit if the most* ***radical protagonists of evidence based medicine organised and participated in a double blind, randomised, placebo controlled, crossover trial of the parachute."***

Research Challenges: Heterogeneity

Krzak JJ, Corcos DM, Damiano DL, Graf A, Hedeker D, Smith PA, Harris GF. ***Kinematic foot types in youth with equinovarus secondary to hemiplegia.*** Gait Posture. 2015 Feb;41(2):402-8.

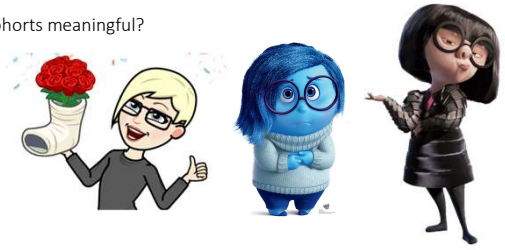
- Participants ***with hemiplegia and equinovarus*** fell between
  - **Five distinct subgroups -**
- Neurotypical controls were distributed among **4** of the subgroups
- Noted: **inherent variability even in neurotypical, asymptomatic movement systems**

Research Challenges: Heterogeneity

Do glasses work for individuals with visual impairment?

Research Challenges: Heterogeneity

- Are cohorts meaningful?



Research Challenges: "Efficacy"

What outcome does each study value?
What level of the ICF are they focusing on?

Varied Recommendations

The Parable of the Roast

Varied Recommendations

*Spastic**
*R1/R2**

Used in current literature describing foot and ankle involvement in the **neurotypical population*

Terminology: Inconsistency - Neuromotor

There is a growing body of evidence that for patients with CP, stroke, and TBI, **passive muscle properties** are:

- Altered
- highly variable between patients
- **difficult to distinguish clinically** from hyper-responsive stretch reflexes

Terminology: Inconsistency - Neuromotor

De Gooijer-van de Groep, K.L., De Vlugt, E., De Groot, J.H., et al. **Differentiation between non-neural and neural contributors to ankle joint stiffness in cerebral palsy.** Journal of NeuroEngineering and Rehabilitation, 10, 2013. July 2013:urn:issn:1743-0003.

- "Ratios between the contribution ***of neural and non-neural components*** to ankle joint stiffness *varied substantially* within the group with CP".
- Even in a group the researchers cohorted for their similarities and were relatively mildly affected.

Terminology: Inconsistency - Neuromotor

Willerslev-Olsen, M, Lorentzen, J, Sinkjær, T, Nielsen, JB. **Passive muscle properties are altered in children with cerebral palsy before the age of 3 years and are difficult to distinguish clinically from spasticity**. Developmental Medicine & Child Neurology. 2013;55(7):617-623.

- *Passive muscle properties are altered in children with cerebral palsy before the age of 3 years and are difficult to distinguish clinically from spasticity.*
- Only 7/35 children determined as having spasticity via MAS/Tardieu had enhanced stretch reflexes with EMG.
- Enhanced stretch reflexes contributed to muscle stiffness in a **minority** of cases.
- Change in passive muscle properties were much more frequently contributing.

Terminology: Inconsistency - Neuromotor

Bar - On, L, Kalkman, BM, Cenni, F, et al. The relationship between medial gastrocnemius lengthening properties and stretch reflexes in cerebral palsy. October 2018:1-11.

- "In general, given the large variability in the amount of muscle lengthening and hyperactive stretch reflex in the subject sample included in this study, **muscle lengthening and stretch reflex hyperactivity in medial gastrocnemius muscles of children with CP is highly variable and that the two do not necessarily co-exist**."
- Authors noted: "**muscle stiffness may actually be considered as a protective mechanism**"

Terminology: Inconsistency - Neuromotor

Passive muscle properties are also being found to be a major contributor to changes in muscle stiffness in:

- Acquired brain injury
- Hemiplegia
- Stroke

Terminology: Inconsistency - Neuromotor

Assumptions → Observations

Terminology: Specificity

Tight		Short
Spastic/spasticity		Decreased muscle length
Hypertonicity		Tonic muscle contraction
Hyperreflexia	→	Spasm

Terminology: Words Have Power

- How do the words we select impact our patients?

Terminology: Words Have Power

deformity

noun **disfigurement, distortion**

1. the quality or state of being deformed, disfigured, or misshapen.
2. *Pathology.* an abnormally formed part of the body.
3. a deformed person or thing.
4. hatefulness; ugliness.

Synonyms for *deformity*

abnormality, defect, impairment, malformation, aberration, asymmetry, unsightliness, warp, malconformation, misproportion, misshape

Terminology: Words Have Power

Pejorative		Neutral "lay" meaning
Pessimistic	→	Optimistic
Ableist		Positively Googleable
Rude		Respectful

Terminology

restriction

noun **limit**

1. something that restricts; a restrictive condition or regulation; limitation.
2. the act of restricting.
3. the state of being restricted.

Synonyms for *restriction*

check	stipulation	contraction	limitation	excess baggage
condition	stricture	cramp	limits	fine print
constraint	bounds	custody	lock	grain of salt
control	brake	demarcation	qualification	no-no
curb	catch	glitch	reservation	small difficulty
regulation	circumscription	handicap	stint	stumbling block
restraint	confinement	hang-up	string	
rule	containment	inhibition	ball and chain

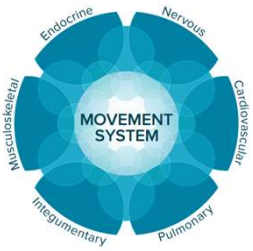
APTA: Movement System

"The movement system is the integration of body systems that generate and maintain movement at all levels of bodily function. Human movement is a complex behavior within a specific context, and is influenced by social, environmental, and personal factors."



American Physical Therapy Association. Movement System. https://www.apta.org/MovementSystem. Accessed October 15, 2019.

Kinesiopathological Model
Shirley Sahrmann, PT, PhD, FAPTA

Sahrmann S, Azevedo DC, Dillen LV. Diagnosis and treatment of movement system impairment syndromes. Braz J Phys Ther. 2017 Nov - Dec;21(6):391-399.

Kinesiopathological Model

- Repetitive movement and sustained alignments can induce pathoanatomical changes in tissues and joint structures
- The body, at the joint level, follows the laws of physics and takes the path of least resistance for movement
- Determinants of the path of motion are
  - intra- and inter-joint relative flexibility
  - relative stiffness of muscle and connective tissue
  - motor control

Sahrmann S, Azevedo DC, Dillen LV. Diagnosis and treatment of movement system impairment syndromes. Braz J Phys Ther. 2017 Nov - Dec;21(6):391-399.

Kinesiopathological Model

- Sustained alignments and repeated movements associated with daily activities are the inducers of tissue adaptations, impaired alignments and movements.
- Micro-instability → tissue microtrauma → macro-trauma

Sahrmann S, Azevedo DC, Dillen LV. Diagnosis and treatment of movement system impairment syndromes. Braz J Phys Ther. 2017 Nov - Dec;21(6):391-399.

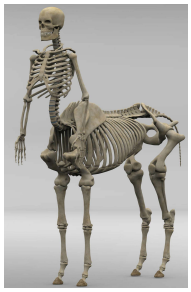
Pediatric Ankle Model

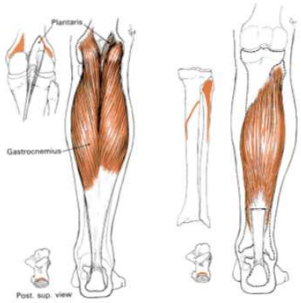
Building a more complex foot/ankle model

Peds/Neuro Ankle Model



Muscles - Plantarflexors

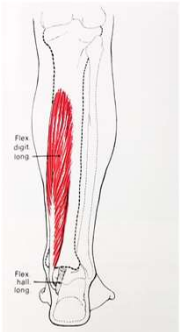
- **Gastrocnemius, Soleus** (complex)
  - plantarflexes ankle
  - flexes knee (gastrocnemius)
  - *slows advancement of the tibia during loading response into midstance*
  - *main driver of the limb from stance into swing*



Kendall, FP. Muscles: Testing and Function; 1993.

Muscles - Plantarflexors

- **Flexor digitorum longus (FDL)**:
  - flexes distal phalanges of lateral four digits
  - **plantarflexes ankle**
  - supports medial and lateral longitudinal arches.



Kendall, FP. Muscles: Testing and Function; 1993.

Muscles – Plantarflexors

- **Tibialis posterior**:
  - attachment on the navicular
  - **plantarflexes ankle**
  - inverts subtalar and transverse tarsal joints
  - supports medial longitudinal arch, controls pronation forces during loading response into midstance

Kendall, FP. Muscles: Testing and Function; 1993.

Muscles – Dorsiflexors

- **Tibialis anterior (TA)**: dorsiflexes ankle, inverts subtalar and transverse tarsal joints, supports medial longitudinal arch, *eccentrically lowers from initial contact into loading response.*
- *Looses moment arm or ability to act when TC DF is restricted… who else can help with DF for function?*

Kendall, FP. Muscles: Testing and Function; 1993.

Muscles – Dorsiflexors

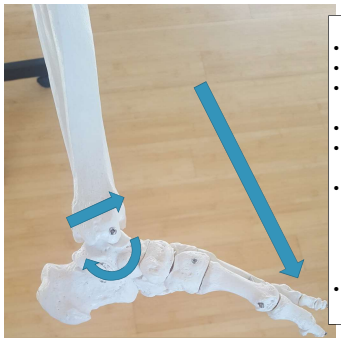
- **Extensor digitorum longus (EDL)**: extends toes, dorsiflexes ankle
- **Peroneus tertius**: (attachment on the base of 5th met) dorsiflexes ankle, *everts at subtalar and transverse tarsal joints.*
- *Longer lever arm for DF if the TA cannot*

Kendall, FP. Muscles: Testing and Function; 1993.

Muscles - Dorsiflexors

- **Extensor hallucis** longus (EHL): extends big toe, dorsiflexes ankle, inverts subtalar and transverse tarsal joints.
- *Longer lever arm for DF if the TA cannot*

Kendall, FP. Muscles: Testing and Function; 1993.



Plantarflexion

- Anterior slide of talus
- Roll of talus
- Lengthening of anterior tendon, ligaments, anterior capsule
- Superior movement of calcaneous
- Shortening of Achilles tendon, calcalneofibular ligament
- Lengthening of
  - Tibialis anterior
  - Extensor digitorum longus
  - Extensor hallucis longus
  - Peroneus tertius
- Movement and glide of fascia and skin

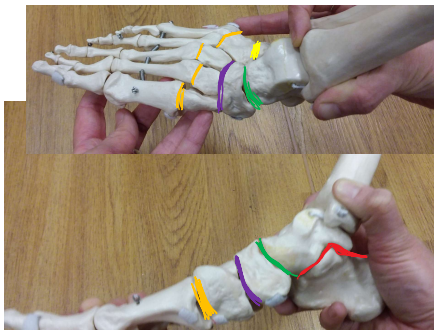
Ankle Structure

Joints

- Talo-crural (talus-tibia/fibula)
- Subtalar (talus-calcaneous)

Joints

- Subtalar (talus-calcaneous)
- Talus-Navicular
- Calcaneous-cuboid
- Navicular-cuneiforms
- Cunieforms/cuboid-metatarsals

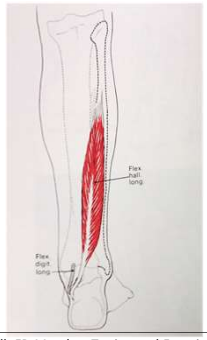


Muscles - Plantarflexors

- **Gastrocnemius, Soleus** (complex)
  - plantarflexes ankle
  - flexes knee (gastrocnemius)
  - *slows advancement of the tibia during loading response into midstance*
  - *main driver of the limb from stance into swing*
  - *eccentrically controls dorsiflexion for descending stairs*

Muscles – Plantarflexors

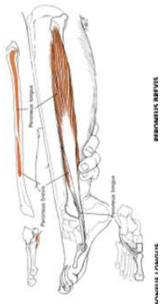
- **Flexor hallucis longus (FHL)**:
  - flexes distal phalanx of big toe
  - **plantarflexes ankle**
  - supports medial longitudinal arch



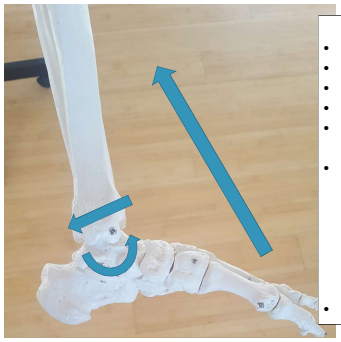
Kendall, FP. Muscles: Testing and Function; 1993.

Muscles - Plantarflexors

- **Peroneus longus**: (attachment on the base of 1st met & medial cuneiform) plantarflexes ankle, everts subtalar & transverse tarsal joints, *supports lateral longitudinal and transverse arches.*
- **Peroneus brevis** (attachment on the base of 5th metatarsal) plantarflexes ankle, everts at subtalar & transverse tarsal joints, *supports lateral longitudinal arch.*



Kendall, FP. Muscles: Testing and Function; 1993.

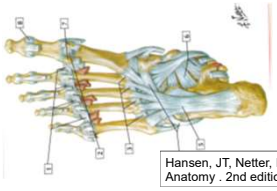


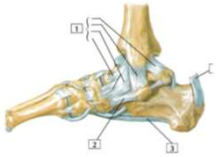
Talocural Dorsiflexion

- Posterior slide of talus
- Roll of talus
- Lengthening of posterior capsule
- Inferior movement of calcaneous
- Shortening of anterior capsule, anterior talofibular ligament
- Lengthening of
  - gastrocnemius
  - Soleus
  - Tibialis posterior
  - Fibularis brevis and longus
  - Flexor hallucis longus
  - Flexor digitorum longus plantaris
- Movement and glide of fascia and skin

Foot Stability

- Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.
  - Passive Subsystem



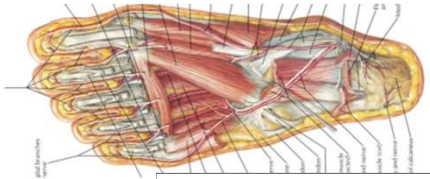


Hansen, JT, Netter, FH, Machado, CA. Netter's Clinical Anatomy . 2nd edition. East Hanover; NJ: Elsevier; 1997.

Foot Stability

Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.

- Active Subsystem



Hansen, JT, Netter, FH, Machado, CA. Netter's Clinical Anatomy . 2nd edition. East Hanover; NJ: Elsevier; 1997.

Foot Stability

Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.

- Active Subsystem
  - Arch of the foot is controlled by both local stabilizers and global movers of the foot, similar to the lumbopelvic core.
  - Local stabilizers ("foot core"):
    - 4 layers of plantar intrinsic muscles that originate and insert on the foot.
    - small moment arms and serve to primarily to stabilize the multiple joints of the foot.
    - act to control the degree and velocity of arch deformation with each foot step
  - Muscular fatigue of foot intrinsics leads to navicular drop

Foot Stability

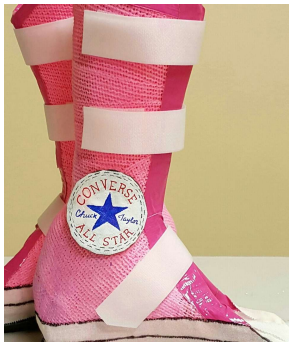
Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.

- Neural subsystem
  - Intrinsic muscles are advantageously positioned to provide immediate sensory information about changes in the foot posture, via stretch response
  - Loss of alignment of the foot leads to loss of this information

Foot Stability

Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.

- Interaction of global movers with foot core
  - The Achilles tendon modulates tension in the plantar aponeurosis based on the common connection to the calcaneous
  - As tension in the gastroc-soleus increases, so does the tension in the planar fascia



Kinesiopathology: The Ankle as a Movement System

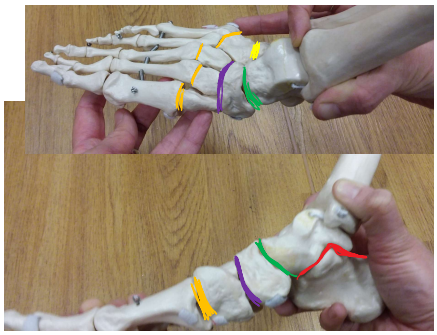
Due to the complexity of the foot and ankle, there are many ways which the system may compensate for MS or NM dysfunction.

e.g. In some systems, accessory motion is ***relatively*** more flexible than talocrural (TC) DF.

False "DF" occurs to bring the foot toward the tibia but the TC joint does not DF.

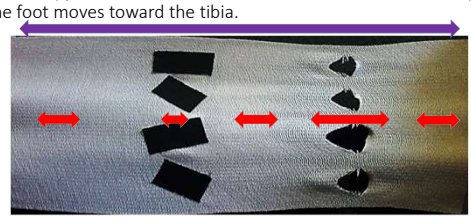
Joints

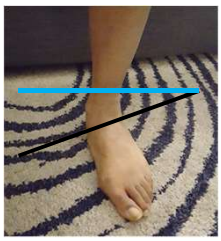
- Subtalar (talus-calcaneous)
- Talus-Navicular
- Calcaneous-cuboid
- Navicular-cuneiforms
- Cunieforms/cuboid-metatarsals



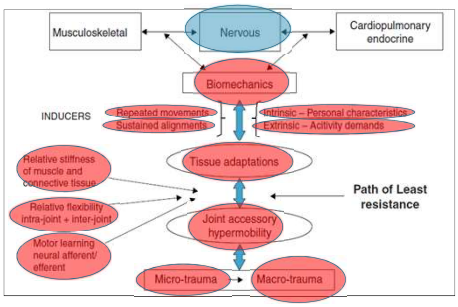
Kinesiopathology: The Ankle as a Movement System

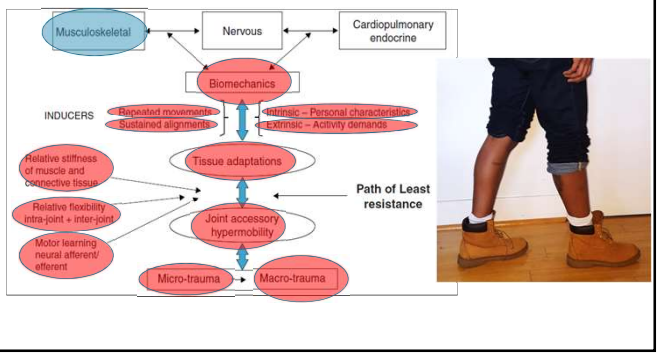
- Df is a component movement of many of the accessory joints of the system, so when the hindfoot is stiff, the dorsiflexion component of accessory joint motion sometimes becomes the dominant way that the foot moves toward the tibia.

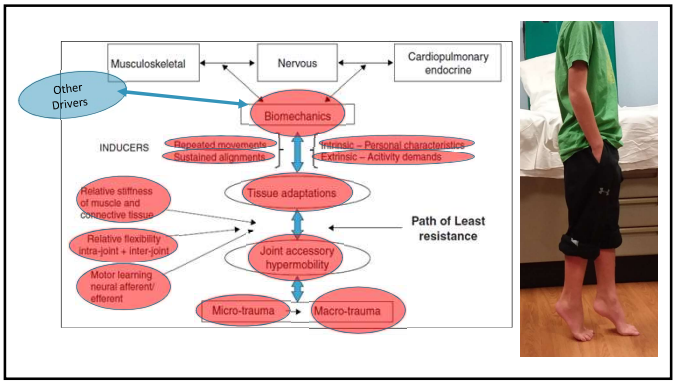




Forces are mechanically directed to relatively more flexible structures and away from TC dorsiflexion.



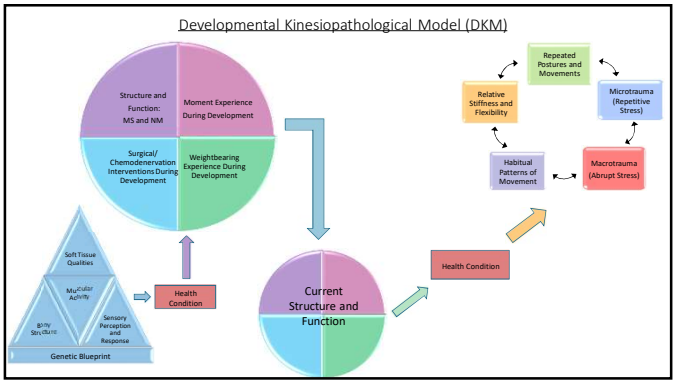


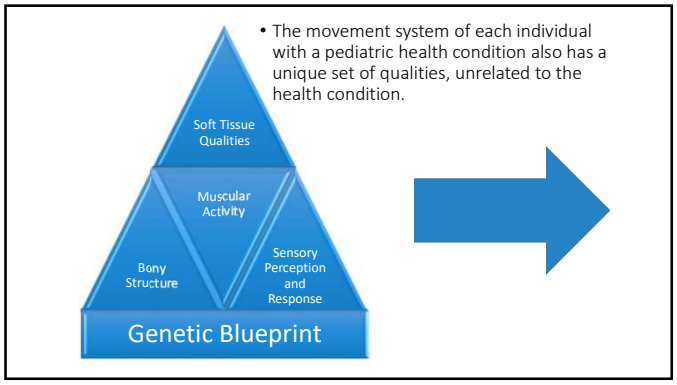


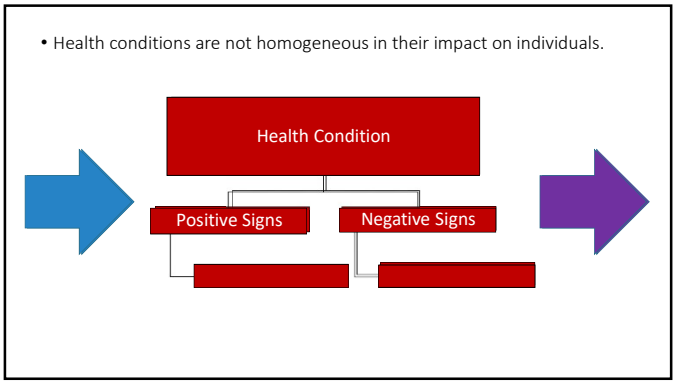
- Limiting Factors vs. Drivers

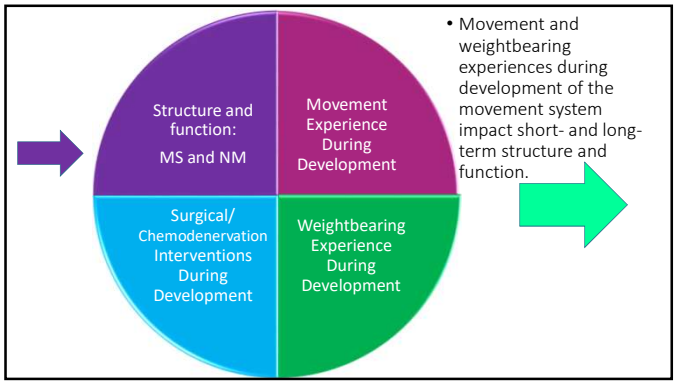
New Paradigm: Developmental Kinesiopathology

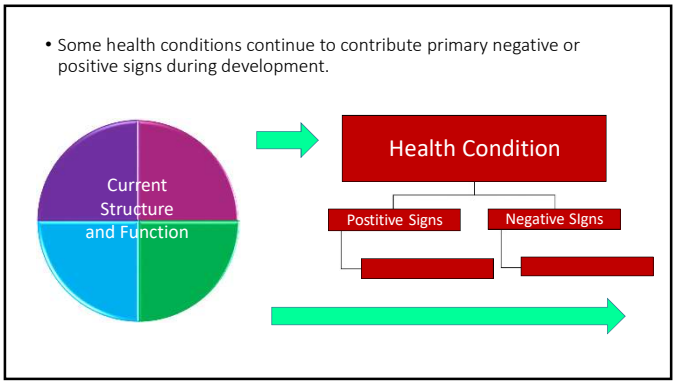
- Function of the movement system is multifactorial and depends not just the health condition, but influence of multiple internal and external factors.
- The structure and function of the mature movement system will be impacted by the movement experiences as it develops.

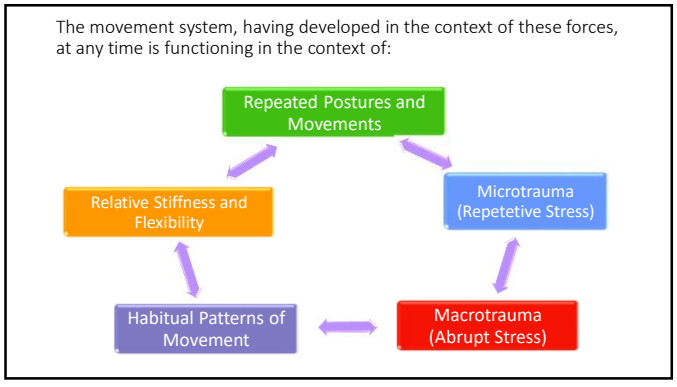












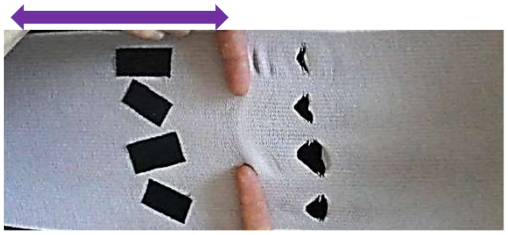
Developmental Kinesiopathology

- The movement and weightbearing experiences during development of the movement system impact short- and long-term structure and function.
  - We will influence long term kinesiopathology with our interventions during development of the system.

Developmental Kinesiopathology: *Musculoskeletal Development*

- By guiding forces during repetitive movement and sustained alignments, we can:
  - provide stress and strain that encourage tissues to form in a manner compatible with healthy movement patterns.
  - reduce the system's tendency to experience microtrauma and macrotrauma in the future.

- For a system that is experiencing atypical stresses during development:
  - Goal of interventions might be to **normalize the stresses on the movement system to maximize MS development in the context of a health condition.**



Developmental Kinesiopathology: *Neuromotor Development*

- Neuroplasticity is greatest before specialization.
- There are critical windows for developing motor patterns.
- Mass practice is required for motor skill development.
- The body becomes efficient in the patterns it performs in mass practice.
- It can be difficult to access new patterns once regular patterns are established.

Developmental Kinesiopathology: *Sensory-Perceptual Development*

- The more the movement system functions in an altered alignment, it is an expert at functioning in that alignment, and the system perceives changes and will attempt to return to the known alignment.

Sensory-Perceptual Development

Mckeon, PO, Hertel, J, Bramble, D, Davis, I. **The foot core system: a new paradigm for understanding intrinsic foot muscle function.** British Journal of Sports Medicine. 2015;49(5):290.

- Neural subsystem
  - Intrinsic muscles are advantageously positioned to provide immediate sensory information about changes in the foot posture, via stretch response
  - Loss of alignment of the foot also leads to loss of this information

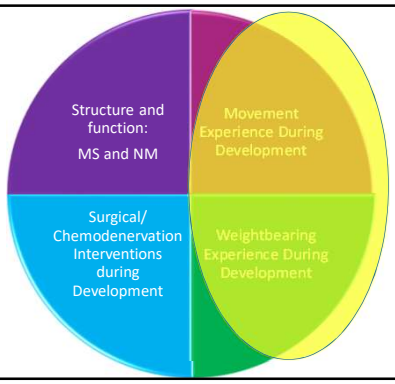
→Loss of alignment of the foot during development impacts the development of the perception of this information

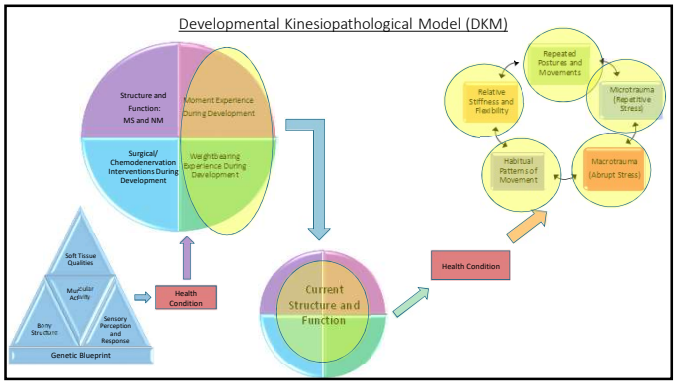
→Biasing the foot intrinsics to develop with typical alignment allows for this information to be available

How are the foot intrinsics in each of these feet able to provide information for the development of balance skills?

Developmental Kinesiopathology

- How can we ask the movement system to move in a certain manner when it was built for something else?





Developmental Kinesiopathological Model of the Movement System

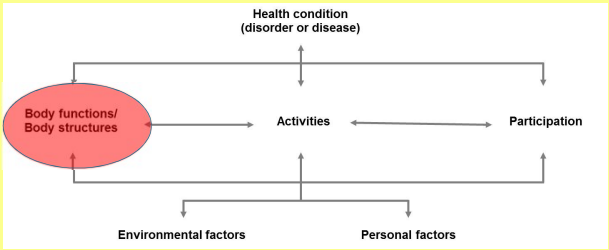
- ……pediatric health conditions?

Neuromotor Findings



Examination: Neuromotor

Positive signs

versus

Negative signs

Examination: Neuromotor

Ability to:

- Initiate contraction
- Maintain contraction against required force
- Relax
- Time and coordinate movement

Examination: Neuromotor

Balance Strategies: ability to:

- Anticipate balance challenges
- Maintain safe posture
- Stabilize joints to prevent damage
- Adjust to the contact surface
- Coordinate global movers and stabilizers for function

Neuromotor and Motor Control Findings

- ❑Neuromotor MSD
- ❑Muscle contraction – in specific muscles/groups
  - ❑Impaired recruiting
  - ❑Excessive or altered timing of recruiting
  - ❑Tonic contraction
  - ❑Impaired endurance
    - ❑Primary
    - ❑Secondary
  - ❑Impaired or altered timing of relaxation
- ❑Balance Strategies

Altered Patterns of Recruitment

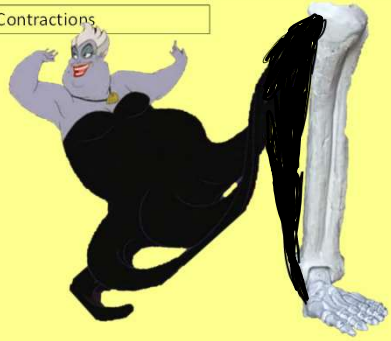
EH & Post Tib > TA

Altered Patterns of Recruitment

EDL > TA

EDL & quad > TA
Tonic TA Contraction

Tonic Contractions

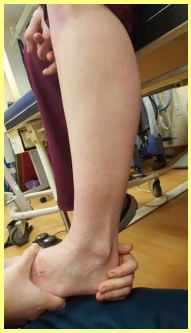


Tonic Muscle Contraction

TA, FDL, Post Tib

EH, Post Tib

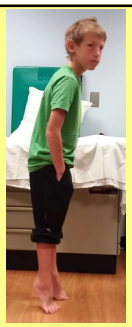
EDL, TA, PL/PB



PL/PB

Post Tib, FDL

Balance Strategies



Hip/Step Strategy

Hip and Toe Strategy

Neuromotor Findings

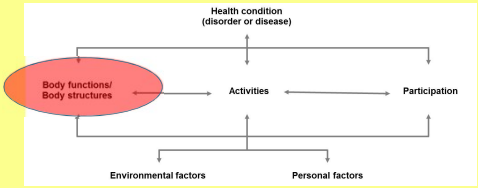
- ❑Atypical habitual patterns of movement
  - ❑Synergies

Neuromotor Findings

- ❑Consistency: does the patient show emerging MN control?

Neuromotor Findings

- Findings



Neuromotor Findings

- Accommodate or address?

Neuromotor Findings

Old Paradigm:

Tonic contractions are a primary result of the health condition

Neuromotor Findings

New Paradigm:

Tonic contractions and tissue stiffness may be an adaptive response to weakness, decreased motor control, and sensory deficits

Intervention: Intrinsic Foot Stability Training

Research:

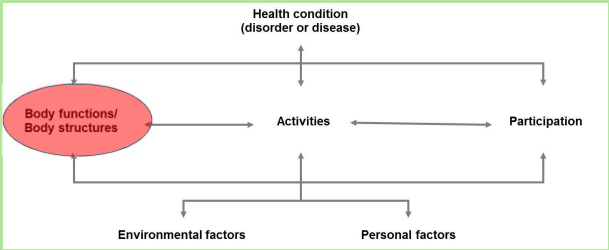
Training foot intrinsic musculature has been shown to impact foot position, static and dynamic balance, and gait dynamics:

- Neurotypical controls
- Ankle instability
- Plantarfasciitis

Intervention: Intrinsic Foot Stability Training

- ……pediatric health conditions?

Sensory Perception and Pain



Sensory Perception and Pain

- ❑Perception of the foot/ankle
  - ❑Hyperperceptive
  - ❑Hypoperceptive

Sensory Perception and Pain

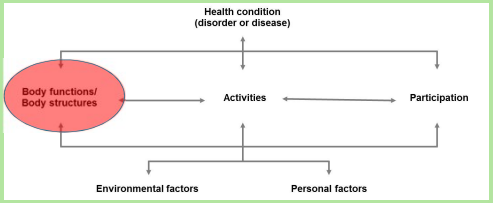
- ❑Altered sensory/perception elsewhere in the greater movement system

Sensory Perception and Pain

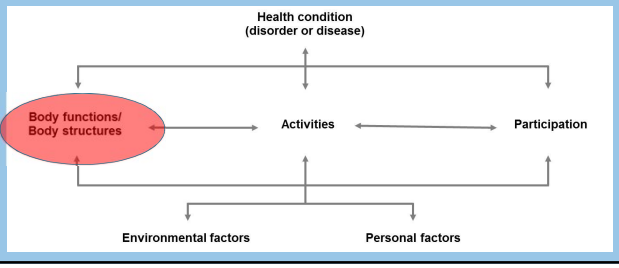
- ❑Pain
  - ❑In foot/ankle/lower leg
  - ❑Elsewhere in kinetic chain

Sensory Perception and Pain Findings

- Findings



Relevant Cardiopulmonary, Integumentary, Neurodevelopmental, Endocrine, Gastrointestinal, Lymphatic System Findings



Relevant Systems

Relevant Cardiopulmonary, Integumentary, Endocrine, Neurodevelopmental, Gastrointestinal, Lymphatic System Findings

- ❑GERD
- ❑ASD
- ❑Cardiopulmary

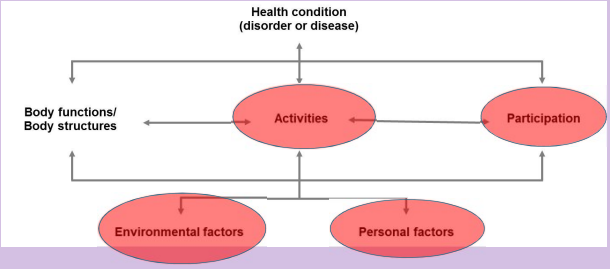
Individual Characteristics



Individual Characteristics

- ❑Sustained alignments based on regular activities
- ❑Participation interests
- ❑Structural demands of the regular and goal environments
- ❑Patient and family goals
- ❑Engagement with therapy and bracing

Key Findings

Task Analysis:
MS:
NM:
Sensory and Pain:
Other Systems:
Individual:

Suspected Drivers:

Limiting Factors:

Goals of Orthotic Intervention:

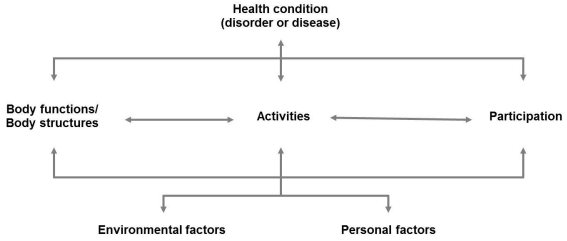
PT's goal:

Patient's goal:

Family's goal:

Other team member's goals:

Goals: Organizing with the ICF Model



Goals: Body Structure and Function

- Lessen the impact of cumulative micro-trauma due to sustained alignments or repeated movements
- Externally support hypermobile structures in the movement system which have become the path of least resistance for ground reaction forces
- Direct forces toward target structures to increase their relative flexibility

Goals: Body Structure and Function

- Restrict or resist motions in planes not compatible for healthy biomechanics
- Influence neuromuscular activation patterns during gait and other weightbearing activities

Goals: Activities

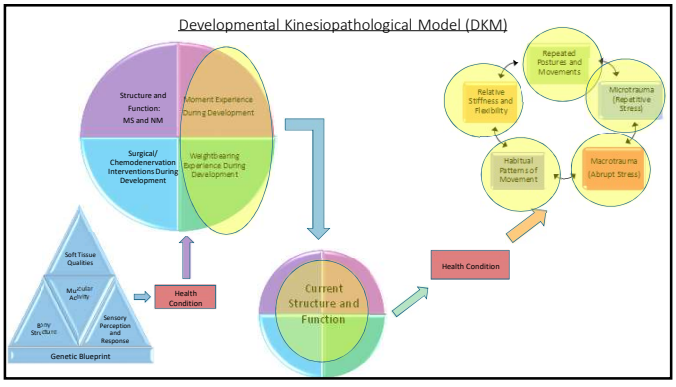
- Improve
  - Function
  - Efficiency
  - Safety

Goals: Environment

- Increase direct access to goal environments and structures

Goals: Participation & Personal Factors

- Social Acceptance
- Self Acceptance
- Fit In
- Stand Out
- Appear Neurotypical
- Celebrate differences
- Be Cool



Goals:
Developmental Kinesiopathological Model

For the patient as an **adult**:

- Minimize negative sequelae of developing in the context of a pediatric health condition
- Minimize pain
- Maximize structural resilience of the movement system
- Maximize neuromotor function and access to varied movement options

Goals:
Developmental Kinesiopathological Model

For the patient as an adult:

- Maximize the environments and activities the patient can access with their movement system in the future
- Maximize acceptance of individual differences
- Maximize the ability to self-advocate and access appropriate resources
- Maximize work and social engagement as an adult

Developmental Kinesiopathological Model of the Movement System

Movement System Analysis Framework: Foot and Ankle

Orthotic Design

Orthotic Intervention:
Developmental Kinesiopathology

- An orthoses can guide forces during repetitive movement and sustained alignments in order to:
  - provide stress and strain that encourage tissues to form in a manner compatible with healthy movement patterns.
  - reduce the system's tendency to experience microtrauma and macrotrauma in the future.
  - provide mass practice of target motor patterns.

Brace "Prescription" versus "Design"

- Prescription: Helping the body interface with the world

Brace “Prescription” versus “Design”

- **Prescription:** Capturing the individual characteristics of the movement system, including structural variants and support of compromised or at-risk structures
- **Design:** Selection of brace features

Brace “Prescription”

- Developed from our Movement System Analysis
- This is a KEY ELEMENT of brace design, apart from style selection, and a key fault of ineffective orthoses.
  - If the style selected is correct, but the movement system has not been captured and supported specifically, the brace will not be appropriate.
  - Appropriate prescription may outweigh appropriate design.

Orthotic Design: Groups

- Group 1: Foot Orthotics (FO)
- Group 2: Supra-Malleolar Orthotics (SMO)
- Group 2+: SMO+
- Group 3: AFO with Movement (AFO-M)
- Group 4: AFO – Solid (AFO-S)
- Group 5: AFO – Sagittal Plane Only (AFO-Sag)

Orthotic Design: Rules

Group 1: Foot Orthotics (FOs)

Group 2: Supra-Malleolar Orthoses (SMOs)

Custom-from casts

Compression-from measurements

Group 2+: Supra-Malleolar Orthoses+ (SMO+)

Group 3: AFOs with Motion

Group 3: AFOs with Motion Flexible Upright (Posterior Leaf Spring)

Group 3: AFOs with Motion Flexible Upright

Group 3: AFOs with Motion Articulated

Free DF

DF Assist

Group 4: AFOs – Solid

Group 4: AFOs – Solid

Group 5: AFOs – Sagittal Only

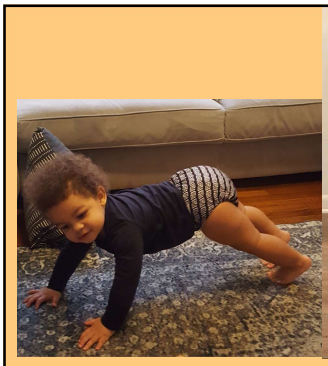
Talo-crual	
Subtalar	
Midtarsals	
Forefoot	
Digits	

Orthotic Prescription: Musculoskeletal Findings

- Do all individuals with structural or functional variants need orthotics?



Orthotic Prescription: Musculoskeletal Findings

- ❑Joint Function
  - ❑Maladaptive relative stiffness/flexibility
  - ❑Altered line of pull of muscles around joints

❑NWB Corrective force test

What support is required to:

→Bring the foot and ankle in into position with the joints congruent?

❑WB Corrective force test

What support is required to:

→correct alignment of hindfoot and midfoot in the frontal and transverse planes to allow dorsiflexion to occur ***primarily*** at the talocrural joint as the shank advances over the foot?

❑WB Corrective force test

Orthotic Design: Coronal Plane

Support needed: Cueing

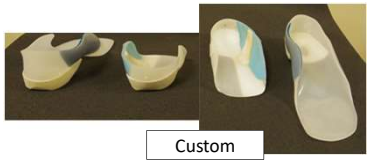
Group 0

- No Intervention
- Monitor
- Stability and foot core training

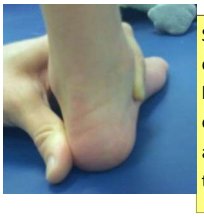
Support at the calcaneous, medial longitunidal arch

Group 1: Foot Orthotics (FOs)

Off The Shelf

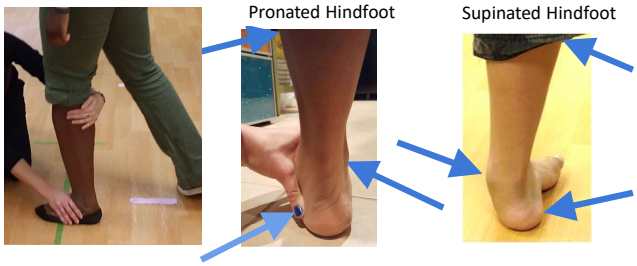


Custom



Support at the calcaneous, medial longitunidal arch, shaft of the 5th metatarsal and around the dorsum of the ankle

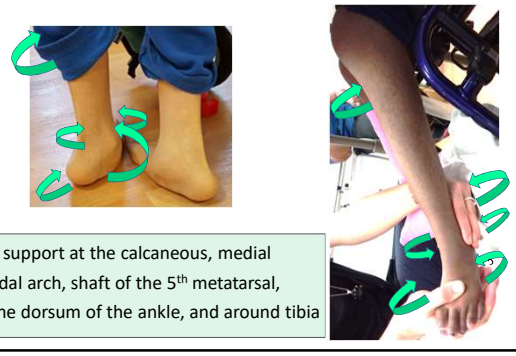
Group 2: Supra-Malleolar Orthoses (SMOs)
Group 2+: Supra-Malleolar Orthoses+ (SMO+)



Support at the calcaneous, medial longitunidal arch, shaft of the 5th metatarsal, around the dorsum of the ankle, at the tibia for a longer lever arm

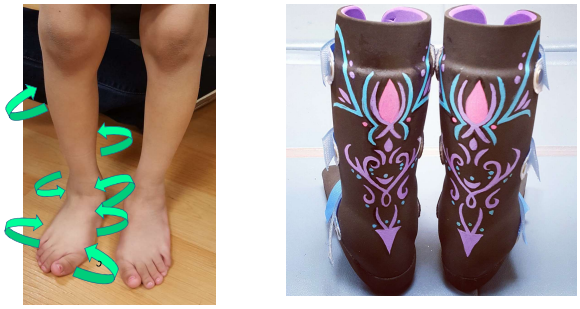
Group 3: AFOs with Motion

Group 5: AFOs – Sagittal Only



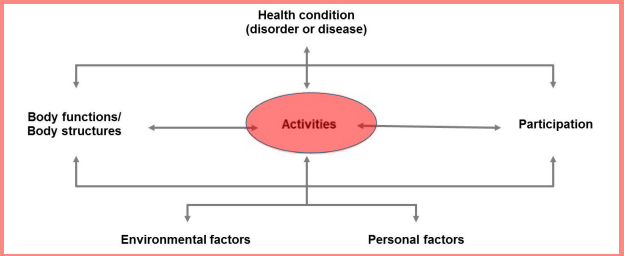
Triplanar support at the calcaneous, medial longitunidal arch, shaft of the 5th metatarsal, around the dorsum of the ankle, and around tibia

Group 4: AFO – Solid



Group 4: AFO – Solid

Functional Status and Task analysis



Orthotic Design: Sagittal Plane
Functional Status and Task analysis

- ❑Does not stand
- ❑Stands but does not ambulate
  - ❑With device (stander or gait trainer)
  - ❑Stands for transfers or other function
  - ❑Pre-ambulatory

What support is required to:

→Support the foot and ankle for safety, weightbearing, and the individual's activities?

Does Not Stand/Limited Standing

Group 0: No Orthotic

Does Not Stand/Limited Standing

Group 4: AFO – Solid

Orthotic Design: Sagittal Plane
Functional Status and Task analysis

- ❑**Initial contact, loading response**

What support is required to:

→Encourage knee flexion versus extension moment during loading response?

or

→Improve eccentric control of tibial advancement during loading response?

Loading Response

Group 1: Foot Orthotics (FOs)
Group 2: Supra-Malleolar Orthoses (SMOs)

Loading Response

Group 2+: Supra-Malleolar Orthoses+ (SMO+)

Loading Response

Group 3: AFOs with Motion

- DF Assist, DF Free

Loading Response

Group 3: AFOs with Motion

Posterior Leaf Spring - Assist in eccentric slowing of the shank

Loading Response

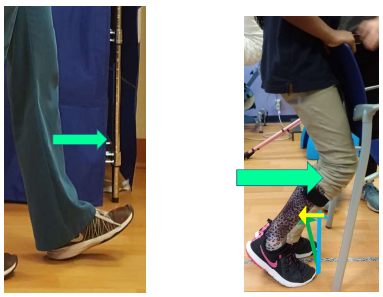
Group 4: AFOs – Solid

Stops progression of shank, chooses one angle and takes you straight there.

Loading Response

Group 4: AFOs – Solid

Stops progression of shank?



Loading Response:
Shank Reversal

Group 5: Sagittal Only AFOs

Anterior Shell

Posterior Shell

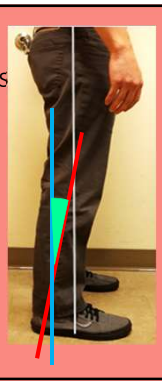
Loading Response:
Impaired Eccentric Control

Group 5: Sagittal Only AFOs

Anterior Shell

Posterior Shell

Orthotic Design: Sagittal Plane Functional Status and Task analysis



❑Midstance

What support is required to:

- Obtain 5-15 degree shank angle in midstance/quiet standing?

- There *can* be 2 angles in an AFO:
  - Angle of the ankle in the orthosis
  - Angle of the shank (tibia) to the floor

❒1-Shank Angle WFL

Movement system is able to compensate for any changes at the foot/ankle

-or-

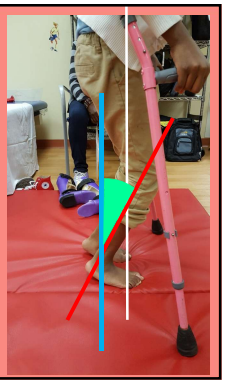
The greater movement system is ***driving*** the change in the foot/ankle

❑ 2-Excessively inclined shank (crouch)

Weight line

- anterior to hip
- posterior to the knee

Shank angle > 15 degrees



❑ 2-Excessively inclined shank (crouch)

Old conventional wisdom: set shank in a reclined angle angle to push the shank backwards. (“Floor reaction AFO”)

In reality, the foot has an inefficient lever arm for this to be effective, and the patient lifts the heel.

❑ 2-Excessively inclined shank (crouch)

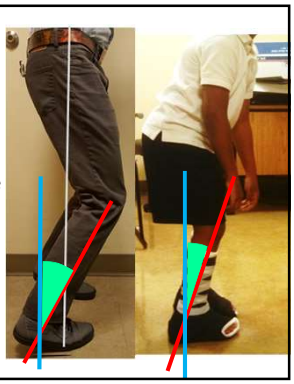
Current theory: Bring the floor up to the heel to provide:

- Heel contact at initial contact and midstance
- Provide a base for the thigh to move from reclined to inclined

❑ 2-Excessively inclined shank (crouch)

Begin to teach the motor system to load through the posterior aspect

Compromise towards the chosen shank angle to get heel contact



❑ 2-Excessively inclined shank (crouch)

- Gradually reduce the shank angle as posterior structures lengthen and motor learning occurs

Excessively Inclined Shank

Group 1: Foot Orthotics (FOs)
Group 2: Supra-Malleolar Orthoses (SMOs)
Group 2+: Supra-Malleolar Orthoses+ (SMO+)

Excessively Inclined Shank

Group 3: AFOs with Motion

- DF Assist, DF Free

Excessively Inclined Shank

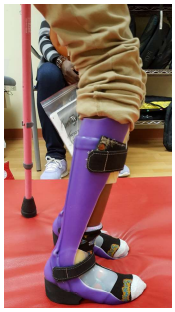
Group 3: AFOs with Motion

Posterior Leaf Spring

Excessively Inclined Shank

Group 4: AFOs – Solid

Removes a degree of freedom—provides a stable base to work on proximal skills for standing and gait alignment.



Excessively Inclined Shank

Group 5: Sagittal Only AFOs

Anterior Shell

Posterior Shell

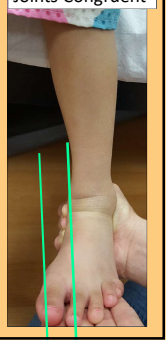
A/P
(+ false coronal)

Ravenclaw

❒Structural Variants

	Coronal Plane	Transverse Plane
Midfoot	Metatatarus Varus	Metatarsus Adductus

Masked



Joints Congruent

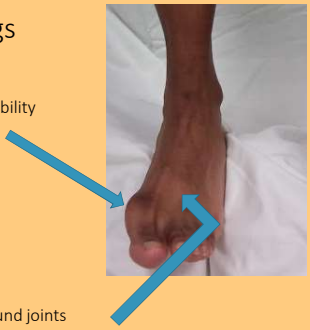
Musculoskeletal Findings

- ❑Functional Variants
  - ❑DF Stress test
    - ❒Pronated hindfoot

End feel/location: often anterior lateral talar impingement

Musculoskeletal Findings

- ❑Joint Function
  - ❑Maladaptive relative stiffness/flexibility



- ❑Altered line of pull of muscles around joints

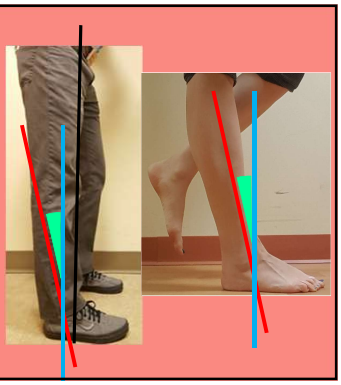
❑ 2-Excessively inclined shank (crouch)

Treatment focuses on learning to bring the thigh from reclined to inclined over a stable base in midstance and quiet stance.

❑ 3-Excessively reclined shank (knee hyperextension)

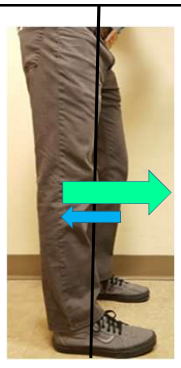
Weight line

- anterior to hip
- anterior to the knee



❑ 3-Excessively reclined shank (knee hyperextension)

- Goal: bring the shank angle forward enough to overcome the tendency for the system to create an extension moment.



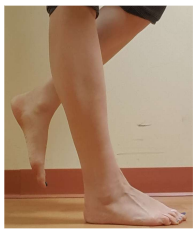
Excessively Reclined Shank

Group 2+: Supra-Malleolar Orthoses+ (SMO+)

Excessively Reclined Shank

Group 3: AFOs with Motion

- DF Assist, DF Free
- If set with a PF block, may overcome reclined shank moment while allowing the gastrocsoleus perform eccentric control of DF.



Excessively Reclined Shank

Group 3: AFOs with Motion

Posterior Leaf Spring

Excessively Reclined Shank

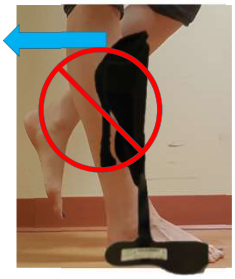
Group 4: AFOs – Solid

- Removes a degree of freedom—provides a stable base to work on proximal skills for standing and gait alignment.
- This stability may assist with motor learning to increase loading through the limb.

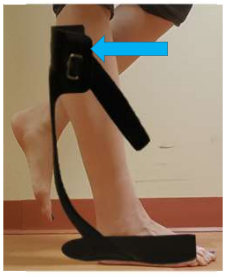
Excessively Reclined Shank

Group 5: Sagittal Only AFOs

Anterior Shell



Posterior Shell



❑ 3-Excessively reclined shank (knee hyperextension)

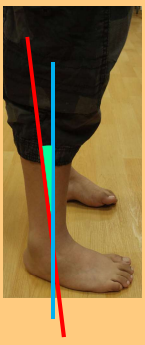
Weight line

- anterior to hip
- anterior to the knee

Musculoskeletal Findings

❑Altered muscle strength or endurance due to health condition

- Weight line is aligned anterior to knee to maintain knee stability
- Shank angle reclined
- Forcing the shank forward will cause uncontrolled knee flexion (buckling) and loss of stability in standing



Excessively Reclined Shank +
Primary lower extremity weakness

Group 4: AFO – Solid

Excessively Reclined Shank +
Primary lower extremity weakness

Group 5: Sagittal Only AFOs

Anterior Shell

Posterior Shell

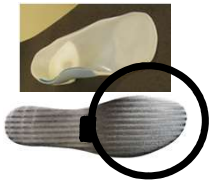
- Terminal Stance
  3rd Rocker

What support is required for:
→Heel contact
→with knee extension
and
→hip extension

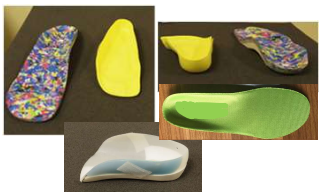
3rd Rocker

Group 1: Foot Orthotics (FOs)

Stiff 3rd rocker



Flexible or free 3rd rocker



3rd Rocker

Group 2: Supra-Malleolar Orthoses (SMOs)
Group 2+: Supra-Malleolar Orthoses+ (SMO+)

Stiff 3rd rocker

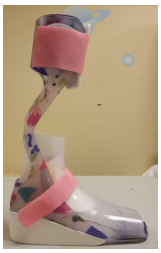
Flexible or free 3rd rocker

- Terminal Stance
  3rd Rocker

What support is required to:
→Store energy to assist with push-off

Energy Storage

Group 3: AFOs with Motion Flexible Upright



Energy Storage

Informs
- Orthotic decision
- Orthotic design
- Orthotic aesthetics
- Orthotic dosage

Minimizing Negative Impacts of Orthotic Intervention on Activities and Participation

Individual Characteristics: Aesthetics

What are our beliefs around the rights of children with special healthcare needs and:

- Fault
- Self Expression
- Autonomy
- Body boundaries

?

Individual Characteristics: Aesthetics

- Physical therapists have an ethical responsibility to support the autonomy of patients, especially those who may have decreased abilities to make choices in their lives and particularly to set boundaries around their bodies.
- We should avoid adding "insult to injury" with ugly orthoses.

Comprehensive Treatment Plan

- Consider the cost of removing a degree of freedom
- Bracing, even solid-ankle does not mean no other intervention to the foot and ankle
- We should always look for opportunities to mobilize, strengthen, and support motor learning
- Dosage can be key for multiple movement experiences
